Cloning and Modifying a React Project from GitHub

This guide will walk you through the process of cloning a React project from GitHub, making changes to the website, and pushing those changes back to the repository.

Steps

1. Clone the Repository

First, you need to clone the repository from GitHub. Use the `git clone` command followed by the URL of the repository.

```
git clone https://github.com/BlockchainFreak/index-test.git
```

2. Install Dependencies

Navigate into the cloned repository and install the necessary dependencies using `pnpm install`.

```
pnpm install
```

3. Start the Development Server

Start the development server using `pnpm dev`.

```
pnpm dev
```

4. View the Website

Open your browser and navigate to `http://localhost:3000` to view the development server and your website.

5. Make Changes to the Website

Now, you can make changes to the website. There is only a single web page. The source code can be founded in `src/pages/index.ts`

6. Commit and Push Changes

```
git add .
git commit -m "Your descriptive commit message"
git push -u origin main
```

Resources

Feel free to use Google, ChatGPT, Stack Overflow and other resources to learn more about any of the steps or commands in this guide. Here are a few to get you started:

Happy coding!
